Re:

Project Name: Port Dover Dredging 2025 - Phase 1

Dear Janet Blackburn,

On July 16, 2025, the Riggs Associates field crew visited Port Dover to collect sediment samples in the harbour and complete a bathymetric survey of the approach channel. The purpose of this expedition was to establish preliminary soil characterizations for the site and to help determine potential dredge grades and boundaries. The sediment samples collected were analyzed by AGAT labs in London, Ontario to assess compliance with the Excess Soils Quality Standards (ESQS) and the Provincial Sediment Quality Guidelines (PSQG).

In this letter we will provide a breakdown of the site, presenting a summary of our findings, the sediment sample laboratory results, and some potential options moving forward for Norfolk County to discuss internally.

1. Port Dover

1.1. Dredge Grades, Dredge Limits, and Cost Estimate

The 2025 sounding survey shows that the entrance to the Port Dover Marina is infilling with sediment from the West. The existing depths in the entrance channel range between 0.5m to 1.8m below chart datum, with most of the shoal forming along the northern side of the entrance. This marina is primarily used for recreational navigation; however, the Coast Guard Search and Rescue vessel (SAR) is located within this marina, and the SAR vessel requires a draft of 1.83m below water level. In the spring of 2025, the SAR vessel was relocated to the Commercial Basin due to inaccessibility into the Port Dover Marina.

Historic records indicate that the Port Dover Marina has been dredged to a depth of 2.5m, which would be adequate for the SAR vessel and recreational sail boats. While analyzing the 2025 sounding data, a preliminary 215m long x 23m wide dredge boundary was established to meet the needs of the SAR vessel and the recreational sail boats (these dredge limits are presented on Figure 1.1). These limits were divided into 4 areas to restore the channel entrance plus incorporate sediment traps for future migrating material. The total volume calculated for these 4 separate dredge areas is presented in Table 1.1.

Table 1.1 – Port Dover Volume calculations

Dredge Area ID	Grade Depth (m) Below Chart Datum	Dredge Volume (m3)	Total Dredge Volume (m3)
DA1	2.5	3,340	7,111
DA2	2.5	1,791	
DA3	2.5	1,286	
DA4	2.5	695	

The cost presented using the volumes shown in Table 1.1 have been calculated using recent project bids of comparable nature in a similar geographic region. For budgeting purposes, the method of dredging assumed for the purpose of this letter is mechanical dredging which typically has a higher cost per cubic meter compared to hydraulic dredging. It is estimated that the cost of mechanical dredging would cost approximately \$711,100; this cost has been calculated using a cost of approximately \$100 per cubic meter of dredge material. Typically, in past dredging project bids the “depth of cut” for the dredge grade can also affect the unit dredge rate; with thin dredge cuts generally resulting in higher unit rates.

The cost estimate presented only represents the cost to dredge the material from the marina, placing it on a barge, then unloading it on the shore to dewater. This estimate does not include costs related to building the dewatering area, trucking the material, building the disposal containment facility or double handling the material into that facility, nor does it include any engineering or consulting related fees to complete a successful dredging project. Typical project costs not included in the estimates presented here can include Design & Engineering, Permitting and Approvals, Construction of the Containment Site, Contract Supervision and Construction Monitoring. At the time of writing this letter, it is too early to quantify these costs for Norfolk County. Once Norfolk County has confirmed their requirement for dredging and disposal, Riggs Associates would be pleased to assist Norfolk County with the next steps towards preparing a dredge contract.

1.2. Sediment Sample Results

As presented in the Sediment Chemistry Summary document (Attached in Appendix A) the sample results for Port Dover showed that all the samples were clean material and met the MOE Table 1 requirements for disposal. However, there was one sample location (2025-01) that slightly exceeded the PSGQ Lowest Effect level (LEL) values. This indicates that this section of the dredge area would not be authorized for propwashing, necessitating a minor adjustment to the dredge boundaries to ensure regulatory compliance.

1.3. Disposal Site

A preliminary upland disposal site was suggested by Norfolk County (The Facility Management Property), unfortunately this site does not have the available storage capacity to construct a perimeter containment berm plus stockpile 7,111m³ of dredge material. In order to move forward with an upland disposal a different site would need to be selected that has the capacity to accept a larger quantity of material and can be (or is already) classified as either a “Class 2 Soil Management Site” or a “Beneficial Reuse Site”.

The new Excess Soil Management regulations (O.Reg 406/19) indicate that dredged material placed temporarily would need to be stockpiled on a site that has been classified as a Class 2 Soil Management Site and would need to be reused within a 2-year window for a separate project. If the dredge material is going straight to a permanent site for use, then this is called a Beneficial Reuse Site. The regulations are also strict when it comes to transporting “Liquid Soils”. This means that the dredge material would need to be dewatered prior to it being transported to the Class 2 Soil Management Site or the Beneficial Reuse Site. This is typically done by one of two methods.

- Building a temporary containment berm near the water’s edge and allowing the material to drain at the worksite, or
- If the material has a very high coarse grain size, then it could be dewatered naturally on the barge as it’s being dredged; then prior to unloading the material for transport, the material would be required to pass a slump test (which are required to be 150mm or less).

1.4. Options to Progress Discussions

Based on the information collected in the field and the sample results from this site, the obstacles currently preventing the Port Dover Marina from being dredged are related to available budget and the lack of a proper in-land disposal facility. A few options to consider are as follows:

- a) A disposal site (Beneficial Reuse Site or a Class 2 Soil Management Site) needs to be identified; this can be achieved in two ways.
 - The most cost-effective solution to up-land disposal is if Norfolk County owns a property (or can purchase a property) large enough to be designated as the disposal site.
 - The alternative is to leave the responsibility of locating the disposal site up to the dredging contractor. However, this will have an additional construction cost associated with it.

- b) Norfolk County needs to increase their budget or reduce the scope of work to fit the existing budget.
- c) The alternative to mechanical dredging and a need for a disposal site is Prop-Washing. This would be a more cost-effective approach for this site and could be implemented annually each spring to prevent the marina entrance from being infilled. Although 3 of the 4 results from the sediment samples collected indicate that this could be a practical option, when analyzing the existing contours plus the orientation of the marina entrance, simply propwashing the material towards the west will not solve the infilling issue. If propwashing the Port Dover Marina is Norfolk County's preferred method forward, it needs to be understood that there are two hindrances to making this a viable option.
- The propwashed material needs to not only be pushed towards the west outside of the marina, but it needs to be pushed to the south of the breakwater ensuring the material doesn't migrate back into the marina entrance.
 - The results of sample #2025-01 prevent propwashing from occurring in this inner harbour area, meaning that this portion of the marina entrance could be left with a navigational depth issue for the SAR vessel without some form of mechanical removal (and up-land disposal) of this material. As mentioned earlier, the east end boundary presented in Figure 1.1 would need to be adjusted towards the west in-order to obtain propwashing approval.

2. Conclusion

The items presented as options in this letter should not be considered as recommendations; the listed items are only presented as suggestions to allow for continued discussions between Norfolk County and its council. Although this site does require dredging to facilitate low water navigation, the costs and the logistics to achieve this goal may not be financially achievable.

Based on the findings presented the Port Dover Marina dredging (using a method of propwashing) is a reachable objective for the recreational vessels providing the budget can be adjusted to accommodate and the material is moved to the south of the breakwater; however due to the sample chemistry at the inner east end, propwashing does not offer a adequate solution for the SAR vessel in low water.

When deciding the appropriate path forward it should be taken into consideration that the Port Dover Coast Guard SAR vessel uses this marina to berth and has had to temporarily relocate due to shallow navigation concerns. At the very least, this indicates to me there is a responsibility for safe navigation of this SAR vessel. It is unknown what (or if) agreements are in-place between the Coast Guard and Norfolk County for maintaining the entrance channel grade depth, but the issue of safe navigation for this vessel should not be ignored.

It is recommended that if Norfolk County has a desire to participate in future dredging projects, obtaining or planning to have access to a local usable disposal site should be explored.

Norfolk County is encouraged to review the findings presented in this document and discuss them internally with council to determine the most appropriate course of action for the Port Dover Marina.

If a cost-effective solution can be reached allowing Norfolk County to move forward with the Port Dover Marina dredging. Riggs Associates can assist Norfolk County with document assembly and permit application submission if the County requires.

APPENDIX A

Port Dover

Sediment Chemistry Results for Preliminary Characterization

August 28th, 2025

Janet Blackburn
Marina Manager,
Port Dover Harbour Marina
East Basin, 50 Passmore Ave
Port Dover, ON N0A 1N0

To whom it may concern,

**Re: Port Dover, Ontario
Sediment Chemistry Results for Preliminary Soil Characterization**

Norfolk County plans to carry out maintenance dredging in the area of Port Dover to provide a safe navigational approach channel for vessels entering or exiting the harbour. The harbour contains multiple businesses, greenspaces and beaches, as well as the Canadian Coast Guard Station Port Dover. Continued safe operation of the harbour is imperative to Norfolk County, and the safety of the public overall.

The intent is to dispose of the dredged material in local upland sites. In addition to The Provincial Sediment Quality Guidelines (PSQG), recent regulations introduced by the Ministry of Environment, Conservation and Parks (MECP) including Ontario Regulation 153/04: Records of Site Conditions (O.Reg 153/04) and Ontario Regulation 406/19: On-Site and Excess Soil Management (O.Reg 406/19), impose new restrictions on movement of excess soils in Ontario. These restrictions include sampling and record keeping requirements, as well as various specific Excess Soil Quality Standards (ESQS) that define how the excess soil may be used. It is important to note that O.Reg 153/04 Schedule E Part V sets out requirements for excess soil sampling frequency based on volume. As these samples were collected for a preliminary characterization, the finalized scope of the project and dredge volumes will dictate the number of additional sediment samples required to comply with the regulation. Based on the proposed dredge volume of 7,111m³, the number of additional sediment samples is expected to be twenty-four (24). The following brief discussion will outline the results of the preliminary soil characterization sediment chemistry and initial impressions.

Sediment collection for preliminary soil characterization was conducted on July 16th, 2025. A total of four samples were collected from within the proposed dredge limits in the harbour. Locations of the samples are shown below in Figure 1. Samples were analyzed at AGAT Laboratories in London, Ontario to assess compliance with the ESQS and PSQG. Complete detailed sediment chemistry comparisons are tabulated in Appendix A. Laboratory results are provided in Appendix B.

Figure 1: Locations of preliminary soil characterization samples

Analyses were completed on each sample for the following sets of compounds:

- Benzene, toluene, ethylbenzene and xylene (BTEX) and F1-F4 Hydrocarbons (C6-C50 chains)
- Metals and inorganics
- Polychlorinated biphenyls (PCBs) and organochlorine (OC) pesticides
- Polycyclic aromatic hydrocarbons (PAHs)
- Particle size
- Nutrients

The only exceedance was nutrients marginally greater than the PSQG Lowest Effect Level (LEL) in Sample 2025-01 from the inner harbour area, as shown below in Table 1. While the sample exceeded the PSQG LEL, the values do not exceed the established Lake Erie background levels for Total Kjeldahl Nitrogen (TKN) and Total Phosphorus (TP). Note that due to recovered sediment sample volume, nutrient analysis was only completed on one sample, and additional samples would be required to confirm consistent concentration throughout. Material exceeding the PSQG LEL but below established background levels is suitable for disposal in water, however significant additional permitting may be required for this course of action.

Table 1: Nutrient results for Port Dover samples

Parameter	Units	PSQG LEL	Back-ground*	Sample ID			
				2025-01	2025-02	2025-03	2025-04
Total Organic Carbon (TOC)	%	1	1.56	0.49	<0.30	<0.30	<0.30
Total Kjeldahl Nitrogen (TKN)	µg/g	550	2000	553	186	86.7	121
Total Phosphorus (TP)	µg/g	600	1300	710	-	-	-

*Background values for nutrients taken from Kemp and Thomas (1976)

All samples were analyzed for particle grain size utilizing a 75 µg sieve resulting in a rough depiction of the soil texture and granularity. All samples consisted of silty sand material. Sample 2025-01 contained greater than 56% fine silt. All other samples contained less than 32% fine silt with the lowest being 19.6%, suggesting a coarser grain size moving to the West out of the harbour, presumably due to protective nature of the harbour allowing more fine sediment to accumulate and settle. Despite the moderate sand content and slight variation throughout the area, based on the current samples, the dredge material would be considered sludgy. The Regulations also place restrictions on the transportation of "liquid soil", meaning soil that does not pass a slump height test of 150mm as prescribed in the regulations. Typically, soils that have higher silt fractions will have a harder time not only dewatering but performing slump tests as well, due to the smaller particle size and denser nature of the material. Therefore, dredged material may have to be dewatered prior to transportation off site.

In conclusion, the initial sediment chemistry analysis found a marginal exceedance in nutrients in Sample 2025-01 from the inner harbour. The value does not exceed the local established background value, which would form the guideline threshold in this case. There were no exceedances of any of the ESQS up to and including Table 1: Site Condition Standard: Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use. Provided any additional required samples are consistent with the initial results, the dredged material will be suitable for a wide variety of uses. Due to the relatively high silt fraction of the dredged material, additional dewatering time or processing may be required prior to transportation of the material.

If you require any further clarification on the contents of this letter, please don't hesitate to reach out.

Kind regards,

Andy Tarrant P.Eng.
Riggs Associates Ltd.

SOIL ANALYSIS REVIEWED BY: Nivine Basily, Inorganic Team Lead
TRACE ORGANICS REVIEWED BY: Oksana Gushyla, Trace Organics Lab Supervisor

DATE REPORTED: Jul 24, 2025

PAGES (INCLUDING COVER): 28

VERSION*: 1

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.
- This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

6898508

Parameter	Unit	G / S	RDL	6898508
Electrical Conductivity (2:1)	mS/cm		0.005	0.554
Sodium Adsorption Ratio (2:1) (Calc.)	N/A		N/A	0.405
pH, 2:1 CaCl ₂ Extraction	pH Units		NA	6.84

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

6898508 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl₂ extract prepared at 2:1 ratio. SAR is a calculated parameter.

Dilution required, RDL has been increased accordingly.

DATE RECEIVED: 2025-07-16

DATE REPORTED: 2025-07-24

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

6898514-6898522 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl₂ extract prepared at 2:1 ratio. SAR is a calculated parameter.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

6898508-6898522 Results are based on the dry weight of the soil.
 DDT total is a calculated parameter. The calculated value is the sum of op'DDT and pp'DDT.
 DDD total is a calculated parameter. The calculated value is the sum of op'DDD and pp'DDD.
 DDE total is a calculated parameter. The calculated value is the sum of op'DDE and pp'DDE.
 Endosulfan total is a calculated parameter. The calculated value is the sum of Endosulfan I and Endosulfan II.
 Chlordane total is a calculated parameter. The calculated value is the sum of Alpha-Chlordane and Gamma-Chlordane.
 The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

6898508-6898522 Results are based on the dry weight of the soil.

Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

SAMPLED BY:

O. Reg. 153(511) - PHCs F1 - F4 (Soil)

DATE RECEIVED: 2025-07-16

DATE REPORTED: 2025-07-24

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

6898508-6898522 Results are based on sample dry weight.
The C6-C10 fraction is calculated using Toluene response factor.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
C6-C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified with the contribution of PAHs. Under Ontario Regulation 153, results are considered valid without determining the PAH contribution if not requested by the client.
Quality Control Data is available upon request.

AGAT QUALITY ASSURANCE REPORT (V1)

AGAT Laboratories is accredited to ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA) and/or Standards Council of Canada (SCC) for specific tests listed on the scope of accreditation. AGAT Laboratories (Mississauga) is also accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) for specific drinking water tests. Accreditations are location and parameter specific. A complete listing of parameters for each location is available from www.cala.ca and/or www.scc.ca. The tests in this report may not necessarily be included in the scope of accreditation. RPDs calculated using raw data. The RPD may not be reflective of duplicate values shown, due to rounding of final results.

Results relate only to the items tested. Results apply to samples as received.
